

Absolute Return Strategy Maximus Capital

September, 2014

It seems that 2013 was the " year of the market " - it is different from the strong growth in stock prices on a par with the painful growth of bond yields (and the corresponding sharp fall in bond prices).

By analogy , we call 2014 "the year of the investor ", which , according to our estimates, will have to spend a lot of time and effort to come to terms with the new reality in both markets .

Most economies have shown positive results compared to last year. Key indicators point to the fact that they need to keep these gains or improve them in 2014 and probably in the future. Very unlikely that the U.S. will fall in the level or even come close to a recession in the next 12-18 months .

If there is no recession in the U.S. , investors in most developed stock markets will be able to assess stocks in terms of their long-term potential for profits. And it is usually associated with economic growth.

If the developed economies like the U.S., Canada, UK, Germany and Japan can grow even at a moderate pace, as seems likely, it would be reasonable to expect that corporate earnings will grow faster fast .

Three major catalyst affecting growth in the global economy :

Energy development :

The International Energy Agency argues that the development of oil shale is growing so fast that the U.S. will become the world's largest oil producer by the end of 2015 , two years earlier than previous estimates. Until now, employment in extractive industries was 66 %.

Revival of production : Industrial production in the U.S. has returned to a consistently high level. China and the U.S. produces about 18% of industrial products worldwide.

Continue to strengthen the process of recovery in housing construction :

Local investments in fixed assets (housing) composes only 2.4 % of GDP in early 2011. By the end of the third quarter of 2013, they reached 3.1% of GDP .

In retrospect, we believe that 50 -year-old crisis to a median of 4.5% -5.0% to reach the level of 2017/2018 year.

All these catalysts - raging oil, updated perspective of production, restoration construction - were in view of the market two years ago and forecasts were skeptical. Today they are recognized, but confidence in the sustainable development is not. It looks quite plausible that each catalyst can affect the growth of GDP in the U.S. in each of the next two years and perhaps further.

Period of recovery in the U.S. will be very beneficial to the economies of other countries.

Imports of goods and services from the rest of the world in the U.S. is about \$ 2.8 trillion a year - more than the GDP of France and the UK than the entire German economy (the fourth largest in the world), and twice exceeds the value of all Chinese exports. If the U.S. GDP will rise to 4% per annum from the current 1.8 %, while imports will grow even more rapidly , providing a welcome boost in all areas.

High probability of the fast pace of growth in the U.S. will produce similar jump in the Canadian economy, the economy of Mexico and several countries in Latin America. Not to mention the economies of China, Japan and most of Asia, as well as in the UK and most European economies. Many of these areas are already showing improvement. China's growth rate seems to have stabilized on a scale of 7 % -8 %.

Eurozone economy emerged from recession in the second quarter and entrenched in the third, but largely due to the strong German economy. Unemployment remains at historic highs above 12% and the European Central Bank suggests that it may get worse before it gets better.

Banks in regions generally do not want to and / or are not able to lend, which affects the ability of the Eurozone out of recession and leaves this question open. On the other hand, the UK economy has left behind the recession a year ago. In the third quarter, GDP grew by 3.2 % per annum. Fourth quarter suggests an even better indicator. Bank of England felt comfortable enough to make changes to your system "debt financing" and add to the scheme on the real estate market position. The unemployment rate fell from 8.4 % in 2012 to 7.6 % in October. Further decline until it seems unlikely. Growing world economy, led by the U.S. and most developed economies are likely to be accompanied by an increase in corporate profits.

Long-term relationship that existed between economic growth and rising income defined prices for all major stock markets.

The next few years may be useful to invest in equity. If the world economy racks up speed in 2014, then bond prices will put pressure on profitability and will rise further.

For 2014, we recommend defensive positioning in favor of shorter maturities, liquidity issues, and selective loans in undervalued sectors.

Investors need to look beyond the absolute return and consider the relative risks.

❑ UNCORRELATED HEDGE FUND PORTFOLIO (40%)

Uncorrelated Hedge Fund Strategy (40%) containing nine of these thirteen funds (being those which would have been both investable and suitable (liquidity depending) for our current fund products), would have returned 38.8% in the crisis period of July 2007 to February 2009 (annualized 21.8%), with volatility of 9.9% and a maximum drawdown of 2.8%. Our team believes that this combination of: long-standing experience in respect of understanding asset management strategies; a real appreciation of what does and does not work within Strategy; and a proven ability to identify distinctive, value-added hedge fund strategies, is the ideal grounding for managing portfolios of hedge funds.

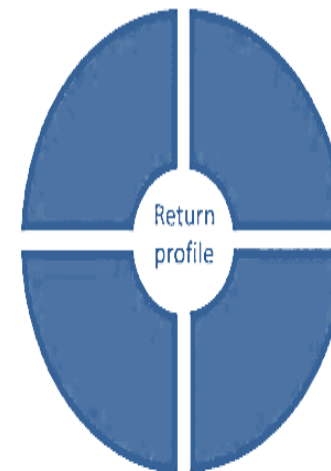

❑ NICHE MARKETS HF PORTFOLIO (40%)

This portfolio contains 5-8 funds which specialize in niche markets and/or asset classes. Typically single manager funds, with at least 3 year proved track record with deep lovely expertise in a specialized field with few competitors and with high barrier of entry.
